

## Answer

Patient B is correct. There is no myocardial  $^{18}\text{F}$ -FDG uptake in patient A. Patient C shows diffuse  $^{18}\text{F}$ -FDG uptake in myocardium because of insufficient preparation.

Abnormal myocardial  $^{18}\text{F}$ -FDG uptake in the basal and apical wall of the LV was detected in patient B. Focal  $^{18}\text{F}$ -FDG uptake is a typical pattern for active inflammation in CS.
